

Improve system water quality.

Marioff HI-FOG® Water Treatment Unit

Water treatment for the HI-FOG systems

The HI-FOG Water Treatment Unit (WTU) is designed to retain system reliability throughout its lifecycle by improving the quality of water used in the HI-FOG systems.

It is suitable for the HI-FOG fire protection systems with different water supply options.

The HI-FOG WTU consists of a dosing station with an electrical dosing pump and tank. The unit feeds an appropriate amount of Marioff-recommended water

treatment additive into the HI-FOG system. The dosing unit recognizes the system flow and doses the needed amount automatically. The unit has a graphical user interface which clearly indicates the amount of additive dosed, its level, and the operational state of the unit.

Key benefits of the HI-FOG WTU:

- Allows for wider water quality range
- Retains system reliability during its lifecycle
- Easy to use, doses automatically

The water treatment unit fits many needs

The HI-FOG Water Treatment Unit is installed on the feed water side of the HI-FOG system. This allows a wider water quality range. The water treatment unit also makes it possible to use demineralized (demi) water as a base.

The WTU is available as an add-on to new HI-FOG water mist fire protection systems. It can also be retrofitted to an existing HI-FOG system.

Marioff is a leading developer of water mist fire protection technology and supplies system solutions worldwide. The company's innovative HI-FOG water mist fire protection system controls and suppresses fire using significantly less water than conventional sprinkler systems, reducing water damage, cleanup time and operational downtime.
